Erratum

Volume 18, Number 3, September 1989, page 179.

We apologize for the error that occurred in the last issue of *African Journal of Medicine and Medical Sciences*. The third paragraph should have read:

Only men had significantly elevated haematocrits. Reduction of a high normal haematocrit is said to improve cerebral blood flow [4], as in the presence of a stenotic vessel wall platelet deposition is said to increase [20]. Smoking is also said to elevate the haematocrit level [21] and advice against this may be beneficial. In this study patients with haematocrits of 48 and over had regular venesection.
